

FABRIC EXPANSION JOINTS

ERRE.DI fabric expansion joints allow to absorb piping vibrations and movements caused by temperature changes.

By virtue of their great elasticity, they can offset movements in different directions at the same time.

The great advantage is that of the little space required for the installation, as well as the great freedom of movement coupled with a small length.

ERRE.DI fabric expansion joints offer a very high corrosion resistance and a great temperature range (from -80°C to 1000°C).
